

SIPtrix™ IP PBX solution

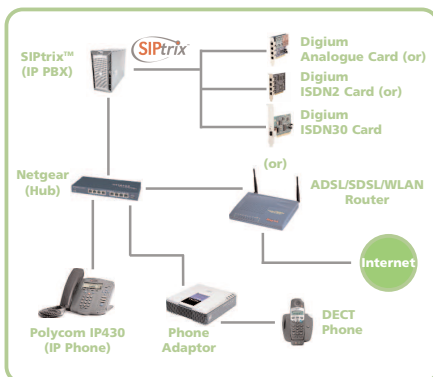

See below for ideas on where SIPtrix™ has been successfully sold.

As a replacement system

SIPtrix™ has been sold in many situations as a simple, replacement phone system.

As it is based on Asterisk, an open source platform, it means that there are *no per licence user costs and no additional charges for features.*

The user receives a feature rich system that is evolving and future proof.

The charge for SIPtrix™ itself is merely a configuration fee (£295) but the system itself includes features such as IVR (Voice Recording) and Voicemail that are often additional cost items on other systems.

As an IP convergent system

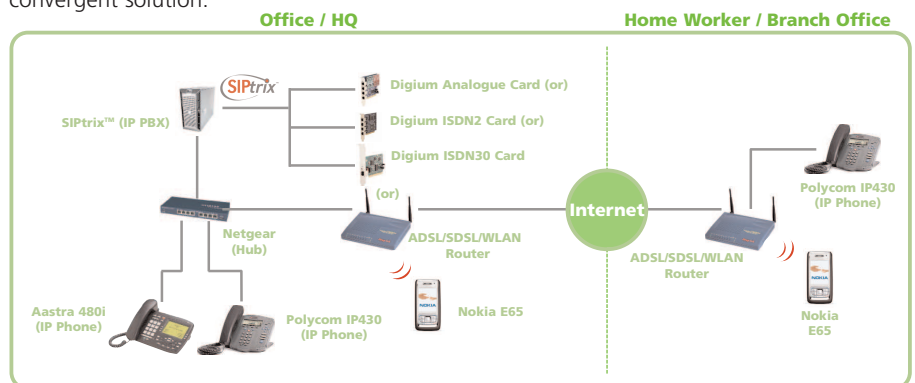

SIPtrix™ has been converged with the latest GSM/SIP phones and email, linking branch offices and long-line extensions.

Convergence is about taking the latest in technology and making it work together, providing a solution that is understandable, usable and is what a customer requires to simplify the way they work.

Other offices within the business and home workers can be linked across the internet to complete the networked phone system. The latest GSM/SIP phones and PDA's can become part of this. Indeed, 45% of all calls made from mobiles are made from one's own office.

Mobiles, as part of the phone system, allow the customer to *enjoy the best least cost routing and can negate the need for desk phones for field based staff, cabling and the associated maintenance costs.*

On the road, the device is an everyday mobile with 'push' email; a truly mobile, convergent solution.

As part of a mobile office

SIPtrix™ has been installed in remote / temporary / mobile offices with 3G Routers and Fixed Cellular Terminals (FCTs) to *form a complete mobile phone and data system.*

Users have access to their email and the internet by connecting over the 3G Router.

Calls in and out will go via the FCTs. This system is ideal for construction sites or any other type of short term or remote office scenario.
